Re: 44.06 acres more or less in the A. Mardez Survey A-48 all in Polk Co., Tx.

Dear Mr. Madden:

In compliance with your request, the undersigned has prepared an appraisal of the property referenced in this report. It is legally described in the body of the report. Please be informed that a careful personal inspection was made of the property. Due consideration was given to all factors and forces that influence property values within the scope of this report regarding the location of the property. The purpose of this report is to derive the market value of the fee simple estate of the surface of the property. **This does not include any oil and gas minerals whether producing or non-producing.**

This report has been prepared in conformity with the Uniform Standards of Professional Appraisal Practice (USPAP) effective 1/1/2024 (To be Determined). This report is intended to comply with reporting requirements set forth under Standard Rules 1 and 2 of USPAP for an appraisal report. As such, it presents only summary discussions of the data, reasoning and analyses that were used in the appraiser process to develop the opinion of value. The supporting documents concerning the data, reasoning and analysis have been retained in our files. The depth of discussion is specific to the nature of the client and the intended use is specified in the report.

No evidence of unusual environmental problems were noted. However, we are not qualified to determine any adverse soil or environmental conditions. If environmental conditions are to be determined, we suggest a Phase I Environmental Risk Report by a qualified professional. In the event that any adverse environmental conditions are discovered, the value indication of this report is not applicable.

This valuation is subject to the Assumptions and Limiting Conditions detailed within the report. It is also subject to any limiting conditions and any special assumptions described in the report. The title opinion was not made available to the appraiser.

Mineral rights owned by the surface owner are considered superior since this allows the surface owner to control or at least some control over the drilling activity on their surface ownership. There is some oil and gas activity in the area and mineral rights can have an influence on value. Therefore, an effort

was made to determine the amount of minerals that are conveyed with each of the sales. It is difficult to determine the exact amount of minerals that convey as most of the time it is stated to be a portion of the minerals owned. The subject property value is being appraised based on typical mineral ownership.

It is an extraordinary assumption the tract will be sold without minerals. This is common in Polk, Tyler, Angelina and Jasper counties. Oil people are educated on mineral sales and do not turn loose anything significant. Minerals with the land are not typical and none of the comparable sales had any significant minerals with them as far as the appraiser knows.

Some of the comparable sales have had an industrial owner in the chain of title. It is common for these companies to retain most of the minerals including a percentage of the commercial water rights. The highest and best use of the subject comparable sales is rural residential, recreation and timber production. The mineral reservations are not considered detrimental to the highest and best uses of the comparable sales or the subject.

The appraiser has been requested to provide the market value of the subject with the hypothetical assumption it is not landlocked. The market value as landlocked is also provided. This tract is not being appraised as an undivided interest.

Indicated value is based on the analyses and conclusions within the report, subject to definitions, and assumptions and limiting conditions stated in the report, it is the appraiser's opinion and conclusion the market value of the subject property as of 9/20/2024 is indicated to be:

WITH HYPOTHETICAL ASSUMPTION THE TRACT HAS LEGAL ACCESS:

Land value of 44.06 acres at \$4,000 per acre	= \$176,240
Contributory value of 44.06 acres timber at \$838 per acre	= \$36,922
Total tract value	= \$213,162 or \$4,838/ac

TWO HUNDRED THIRTEEN THOUSAND ONE HUNDRED SIXTY-TWO DOLLARS

THE VALUE OF THE TRACT AS LAND LOCKED WITH THE ASSUMPTION THE TIMBER COULD BE HARVESTED IS ESTIMATED TO BE AS OF 9/20/2024:

Land value of 44.06 acres at \$4,000 less 40% discount per acre	= \$105,744
Contributory value of 44.06 acres timber at \$838 per acre less 40% discount per ac	= \$ 22,153
Total tract value	= \$127,897
Per acre discounted	\$2,903

ONE HUNDRED TWENTY SEVEN THOUSAND EIGHT HUNDRED NINETY-SEVEN DOLLARS

The appraiser has substantial data regarding the discount from landlocked tracts. Typically there is a 35-45% discount for a landlocked tract. There is a document in the addenda that give support as to why tracts are discounted for access.

Often the adjoining landowner will give more for the tract than other buyers. This is a result of them wanting to add to their property for various reasons. Or it may be they have access to the landlocked tract and can avoid paying full market price for other acreage down the road.

Please feel free to let me know if you desire additional information concerning this report or if the appraiser can be of further assistance in the matter.

Respectfully submitted,

A handwritten signature in blue ink that reads "Harry Faulkner". The signature is written in a cursive style with a large, stylized 'H' and 'F'.

CERTIFICATION: I / We certify that, to the best of our knowledge and belief:

1. The statements of fact contained in this report are true and correct.
2. The reported analyses, opinions and conclusions are limited only by the reported assumptions and limiting conditions and is my personal, unbiased professional analyses, opinions and conclusions.
3. I have no present or prospective interest in the property that is the subject of this report, and I have no personal interest or bias with respect to the parties involved. **The appraiser has not appraised the subject in the past three years.**
4. My engagement in this assignment was not contingent upon developing or reporting predetermined results.

This appraiser does not condone discrimination of any kind toward clients or users of this appraisal report. This includes race, age, color, creed, national origin, sex, gender or sexual orientation , religion, and citizenship status.

5. My compensation for completing this assignment is not contingent on the development or reporting of a predetermined value or direction in value that favors the cause of the client, the amount of the value estimate, the attainment of a stipulated result or the occurrence of a subsequent event directly related to the intended use of this appraisal.
6. I have made a physical inspection of the subject property.
7. No one provided significant professional assistance to the person or persons certifying this report.
8. As of the date of this report, I/we have completed the requirements under the continuing educational requirements of the TEXAS APPRAISERS' LICENSING AND CERTIFICATION BOARD.
9. The appraiser is in compliance with the Competency Rule of USPAP.
10. My analyses, opinions, and conclusions were developed and this report has been prepared in conformity with the Uniform Standards of Professional Appraisal Practice. Effective Date 1/1/2024 (To be determined).

LOCATION MAP SUBJECT

TOP IS NORTH

LOCATION: From intersection of US 59 on north edge of Corrigan proceed east 3.85 miles to 31.008822 and -94.768740 . Tract is about 1000 feet south of FM 352 near the midpoint of the tract.

GENERAL INFORMATION

Intended Use / Purpose of This Report

The intended user of this report is Vernon Madden. The intended use is for the client to make an informed decision regarding the sale of the subject. . The only named user of the report is Mr. Bill Gyarmathy and he is authorized to see the appraisal.

Client

The client in this report is Vernon Madden. The appraisal district shows the tract in the names of Vernon Madden and Diane Haverland.

Effective Date of Value 9/20/2024 **Date of Report** 10/4/2024

Property Owner:

Vernon Madden and Diane Haverland based on appraisal district information.

Property Appraised

Fee simple surface subject to any existing easements, excluding the hydrocarbon minerals whether non-producing or producing.

Location:

LOCATION: From intersection of US 59 on north edge of Corrigan proceed east 3.85 miles to 31.008822 and -94. 768740 . Tract is about 1000 feet south of FM 352 near the midpoint of the tract.

Legal Description:

Re: 44.06 acres more or less in the A. Mardez Survey A-48 all in Polk Co., Tx.

Property Rights Appraised

The fee simple surface estate of the subject is being appraised. Oil and gas minerals are not being appraised. The current market value is to be determined.

Current Use Recreation, timber production, and investment

Three-Year Sales History of the Subject Property

The subject has not sold in the past three years. As far as the appraiser knows it has not been advertised for sale.

The neighbor told the appraiser he had made a \$2,500 per acre offer for the tract as landlocked.

Qualifications of the Appraiser - Provided in the Addenda of this report.

Scope of Work

The appraiser:

- a. will inspect and catalog the salient attributes of the subject property;
- b. will investigate appropriate market data for utilization in a sales comparison approach to value, and if appropriate, cost and income capitalization approaches. Appraiser's investigations will include research of public records through the use of commercial sources of data such as printed comparable data services, computerized data-bases, etc. Texas is a non-disclosure state. It is important the intended users of the report understand that in Texas, there is no legal requirement for the grantors or grantees to disclose any information relative to a transfer of real estate other than to record the deed of transfer. In Texas, the deed is not required to state the purchase price. Typically, it says, "\$10 Dollars and other Good and Valuable Considerations". As a result, no data source provides absolute coverage of all transactions. It is possible there are sales which we are unaware. Our data sources typically provide all the data typically available to appraisers in the ordinary course of business.

Search parameters such as dates of sales, leases, locations, sizes, types of properties and distances from the subject will start with relatively narrow constraints and, if necessary, be expanded until appraiser has either retrieved data sufficient (in appraiser's opinion) to estimate market value, or until appraiser believes that appraiser has reasonably exhausted the available pool of data. Researched sales data will be viewed and, if found to be appropriate, efforts will be made to verify the data with people directly involved in the transactions such as buyers, sellers, brokers, or agents. At appraiser's discretion some data will be used without personal verification if, in appraiser's opinion, the data appears to be correct. In addition, appraiser will consider any appropriate listings or properties found through observation during appraiser's data collection process. Appraiser will report only the data deemed to be pertinent to the valuation problem;

- c. will investigate and analyze any pertinent easements or restriction on the fee simple ownership of the subject property. It is the client's responsibility to supply the appraiser with a title report. If a title report is not available, appraiser will rely on a visual inspection and identify any readily apparent easements or restrictions;

- d. will analyze the data found and reach conclusions regarding the market value, as defined in the report, of the subject property as of the date of value using appropriate valuation approach(es) identified above;

- e. will complete the appraisal report in compliance with appraiser's interpretation of the Uniform Standards of Professional Appraisal Practice as promulgated by The Appraisal Foundation.

- f. will not be responsible for ascertaining the existence of any toxic waste or other contaminants on or off the site. Appraiser will, however, report any indications of toxic waste or other

contaminates that may affect value if they are readily apparent to me/us during appraiser's investigation. The user of the report is advised that appraiser is not an expert in such matters and the appraiser may overlook contamination that might be readily apparent to others

g. will prepare a report which will include photographs of the subject property, descriptions of the subject neighborhood, the site, any improvements on the site, a description of the zoning, a highest and best use analysis, a summary of the most important sales used in appraiser's valuation, a reconciliation and conclusion, a map illustrating the sales in relationship to the subject property, and other data deemed by the appraiser to be relevant to the report. Pertinent data and analyses not included in the report may be retained in appraiser's files.

ASSUMPTIONS AND LIMITING CONDITIONS

1. This is an Appraisal Report (as determined by USPAP effective 1/1/2024, (Expiration date to be determined.) that is intended to comply with the reporting requirements set forth under Standard Rules 1 and 2 of the Uniform Standards of Professional Appraisal Practice for an Appraisal Report. As such, it may not include full discussions of the data, reasoning, and analyses that were used in the appraisal process to develop the appraiser's opinion of value. Supporting documentation concerning the data, reasoning, and analyses is retained in the appraiser's file. The depth of discussion contained in this report is specific to the needs of the client and for the intended use stated in this report. The appraiser is not responsible for unauthorized use of this report.
2. No responsibility is assumed for legal or title considerations. Title to the property is assumed to be good and marketable unless otherwise stated in this report.
3. The property is appraised free and clear of any or all liens and encumbrances unless otherwise stated in this report.
4. Responsible ownership and competent property management are assumed.
5. The information furnished by others is believed to be reliable. However, no warranty is given for its accuracy.
6. All engineering is assumed to be correct. Any plot plans and illustrative material in this report are included only to assist the reader in visualizing the property. (Low value improvements were excluded from the value). There are none.
7. It is assumed that there are no hidden or unapparent conditions of the property, subsoil, or structures that render it more or less valuable. No responsibility is assumed for such conditions or for arranging for engineering studies that may be required to discover them.
8. It is assumed that there is full compliance with all applicable federal, state, and local environmental regulations and laws unless otherwise stated in this report.
9. It is assumed that all applicable zoning and use regulations and restrictions have been complied with, unless a nonconforming use has been stated, defined, and considered in this appraisal report.
10. It is assumed that all required licenses, certificates of occupancy or other legislative or administrative authority of any local, state, or national governmental or private entity or organization have been or can be obtained or renewed for any use on which the value estimates contained in this report are based.
11. Any sketch in this report may show approximate dimensions and is included to assist the reader in visualizing the property. Maps and exhibits found in this report are provided for reader reference purposes only. The maps or aerial photographs may not be to scale and are provided only to assist the user to visualize the property. No guarantee as to accuracy is expressed or implied unless otherwise stated.

2. It is assumed that the utilization of the land and improvements is within the boundaries or property lines of the property described herein and that there is no encroachment or trespass unless otherwise stated in this report.
13. The appraiser is not qualified to detect hazardous waste and/or toxic materials. Any comment by the appraiser that might suggest the possibility of the presence of such substances should not be taken as confirmation of the presence of hazardous waste and/or toxic materials. Such determination would require investigation by a qualified expert in the field of environmental assessment. The presence of substances such as asbestos, urea-formaldehyde foam insulation, or other potential hazardous material may affect the value of the property. The appraiser's value estimate predicated on the assumption that there is no such material on or in the property that would cause a loss in value unless otherwise stated in this report. No responsibility is assumed for any environmental conditions, or for any expertise or engineering knowledge required to discover them.
14. The appraiser's descriptions and resulting comment are the result of the routine observations during the appraisal process. This does not constitute a formal inspection by a state licensed real estate inspector where applicable.
15. Unless otherwise stated in this report, the subject property is appraised without a specific compliance survey having been conducted to determine if the property is or is not in conformance with the requirement of the Americans With Disabilities Act. The presence of architectural and communications barriers that are structural in nature that would restrict access by disabled individuals may adversely affect the property's value, marketability, or utility.
16. Low areas and other areas fronting creeks, streams, rivers and lakes may be subject to flooding and wet conditions. These type areas may be subject to Corp of Engineers regulatory authority under the Clean Water Act of 1977, 33 U.S.C. 1251 et seq. A qualified professional and/or the Corp of Engineers should be contacted for a wetland determination prior to changes in the landscape in this type area.
17. Any proposed improvements are assumed to be completed in a good skillful manner in accordance with the submitted plans and specifications. In this appraisal, no plans and specifications were submitted. **No building improvements.**
18. Possession of this report or a copy of it does not carry with it the right of publication. It may not be used for any purpose by any person other than the party to whom it is addressed without the written consent of the appraiser, and in any event, only with proper written qualifications and only in its entirety.
19. Neither all nor any part of the contents of this report (especially any conclusions as to value, the identity of the appraiser, or the firm with which the appraiser is connected) shall be disseminated to the public through advertising, public relations, recent sales, or other media without prior written consent and approval of the appraiser.
20. The distribution of the total valuation in this report between land and improvements applies only under the reported highest and best use of the property. The allocations of value for

the purposes of land and improvements must not be used in conjunction with any other appraisal and are invalid if so utilized.

21. The report and data investigated except that furnished by the client, remains the sole property of this appraisal business.
22. We have no objection to your use of the appraiser's name as the author of the report which is to be prepared, and thereby consent to your making reference to such report in your reports or financial statements and in any document filed with any governmental agency, provided that: 1) prior to making any such reference in any report or statement or any document filed with The Securities and Exchange Commission or other governmental agency, we are allowed to review and approve the text of such reference to determine the accuracy and adequacy of such reference to the report prepared by our firm; 2) in our opinion, the proposed reference is not untrue or misleading and is adequate for the purposes intended in light of the circumstances under which it is made; and, 3) such reference to the report includes language to be approved, by our firm.
23. Loss or removal of any portion of this report invalidates the entire report.
24. The appraiser is appraising only the surface rights, excluding any hydrocarbon minerals unless otherwise specified in the report. In the past few years, there has been a large amount of oil and gas leasing and exploration activities. The surface owner may or may not own the minerals and therefore may not be able to have any control over the exploration activities or the location of any drilling or production equipment. This appraisal does not consider any possible potential damages resulting from this activity unless the activity is obvious on this tract on the date of inspection.
25. If required to appear in court or to give testimony regarding this appraisal the appraiser will be paid for travel, mileage, preparation time and testimony based on negotiated rates for the necessary work. If subpoenaed by any party the client will pay the appraiser for testimony and court preparation.
26. The appraiser is requested to give a land value on timbered tracts. There may or may not be timber on tracts considered timberland for appraisal purposes. The extraordinary assumption is made the timber has been removed for this purpose. Assumption is made the tract is likely to have some Stream Management Zone (SMZ) or Aesthetic Management Zones (AMZ). On larger tracts some cutting is likely to occur on large SMZ or AMZ areas. This is considered when the timber values are extracted to get to bare land. When applicable and comparable cut over tracts can be used, they are.

DEFINITIONS

Following are the definitions of certain terms used in this report:

Market Value per USPAP 2024 is: Market Value: a type of value, stated as an opinion, that presumes the transfer of a property (i.e., a right of ownership or a bundle of such rights), as of a certain date, under specific conditions set forth in the value definition that is identified by the appraiser applicable in an appraisal.

Title XI of FIRREA, 12 CFR 564.2(f) and CFR Part 614 (Source for Scope of Work in this appraisal)

Market Value of the subject property, as reported, conforms to the definition defined in 12 CFR Part 34.42 (g); 55 Federal Register 34696, August 24, 1990, as amended at 57 Federal Register 12202, April 9, 1992; 59 Federal Register 24499, June 7, 1994):

Market Value means the most probable price which a property should bring in a competitive and open market under all condition's requisite to a fair sale, the buyer and seller each acting prudently and knowledgeably, and assuming the price is not affected by undue stimulus. Implicit in this definition are the consummation of a sale as of a specified date and the passing of title from seller to buyer under conditions whereby:

1. buyer and seller are typically motivated.
2. both parties are well informed or well advised, and each acting in what they consider their own best interest.
3. a reasonable time is allowed for exposure in the open market.
4. payment is made in terms of cash in U.S. Dollars or in terms of financial arrangements comparable thereto.
5. the price represents the normal consideration for the property sold unaffected by special or creative financing or sales concessions granted by anyone associated with the sale.

Fee Simple Estate

Fee simple estate is defined as "absolute ownership unencumbered by any other interest or estate, subject only to the limitations imposed by the governmental powers of taxation, eminent domain, police power and escheat."

Exposure Time

1. The time a property remains on the market;
2. The estimated length of time the property interest being appraised would have been offered on the market prior to the hypothetical consummation of a sale at market value on the effective date of the appraisal; a retrospective estimate based upon an analysis of past events assuming a competitive and open market. Exposure time is always presumed to occur prior to the effective date of the appraisal. The overall concept of reasonable exposure encompasses not only adequate, sufficient and reasonable time, but also adequate, sufficient and reasonable effort. Exposure time is different for diverse types of real estate and value ranges

and under various market conditions. Exposure period for the subject appraisal is indicated to be 3-24 months.

Reasonable Marketing Period

Price or value and marketing time are critically interdependent — each has a direct impact on the other. The typical charge to the appraiser is to estimate the probable cash-equivalent market value of the property that is achievable as of the effective date of valuation. A reasonable marketing time period for real property assumes professionally assertive marketing strategy and efforts, adequate time for exposure and an achievable cash-equivalent sale price/value as of the effective date.

The appraised “market value” estimates as contained in this report reflect estimates of applicable cash-equivalent assuming a sale within approximately three (3) to twenty-four (24) months of the effective dates of value. Such an estimate regarding the “reasonable marketing period” phrasing as contained in *The Dictionary of Real Estate Appraisal*, 3d ed. (Chicago: Appraisal Institute, 1993), p. 140.

The “market value” definition is our interpretation of a reasonable, normal marketing period for most real estate. Any lengthier period would generally be considered unreasonable and nebulous.

Differentiation between the “exposure time” and “marketing time” is also required. Reasonable exposure period is the amount of time necessary to expose a property to the open market in order to achieve a sale. Marketing time is the length of time it would probably take to sell the property if it were placed on the market on the date of the value opinion. These are two distinct periods — exposure time ~ on the date of the value opinion and marketing time begins on that date. They may or may not be similar depending on whether market activity in the immediate future continues in the same manner as in the immediate past.

Indications of the “exposure time” associated with the value estimates herein are provided by the marketing times of available comparable sales, interviews with participants in the market and analysis of general economic conditions. Typically, these exposure times are three to sixteen months. Estimation of future marketing time is more difficult, requiring forecasting and trend analyses. This being more vulnerable to volatile financial market changes.

DEFINITIONS SUMMARY

Market Value

Regarding the subject property, a 3-to-24-month marketing time is again expected to apply, given reasonable “asking” price levels. This is based upon typical exposure times for a large part of the vacant land sales subsequently included herein, as well as appropriately reflecting any significant recent changes in applicable market demand.

Polk County is located about 1.5 hours north of Houston. It is east of Lake Livingston a few miles. This is a recreational area and retirement area. Jobs are provided by government, school districts and the state prison system.

DEFINING AND DESCRIBING NEIGHBORHOOD AND MARKET AREA

Delineating precise market area boundaries is challenging because markets may overlap and it may be difficult to decide how narrowly or broadly to define a market area. The following is provided to assist in identifying potential market characteristics for identifying a market area, but not to present the techniques for delineating and segmenting a market area.

Market characteristics that delineate a market area: "The market area for the buyer/seller market is usually different from the market area for the user market. The market area for the buyer/seller market could be international, say, for a hotel, while the user market for the hotel could be within the country. Thus, market delineation for valuation has two main parts:

1. Analysis of the user market (owners, occupants, and the competition)
2. Analysis of the buyer/seller market.

"The user market is identified before the buy/sell market is determined because the user market sets the basis of highest and best use, which in turn sets the parameters of the substitute property comparable sales identified in the buy/sell market."

Market area might need to be considered. Care should be taken to analyze and align the specific neighborhood characteristics to ensure they are truly competitive.

How a market area and neighborhood may be the same or differ: "A neighborhood may be the general area around a tract of land within a county. People will generally be going to the same city, hospital, schools, churches and stores for shopping. However, a 'market area' may also encompass other cities that are suitable alternatives and draw from the same buyer pool as the subject, even if they are across counties. The buyer pool ultimately defines the market area; if buyers consider the cities/counties/neighborhoods to have similar appeal, then it is likely the cities/ counties/neighborhoods are suitable competition and could be considered within the same market area.

Rural and commercial properties may have demand drivers from diverse locations. Thus, delineating the market areas for these uses usually starts with identifying the competitive cluster of properties/tracts that compete for some of this diverse market of users."¹⁶

"The term market area may be more relevant to the valuation process than either neighborhood or other location parameters for several reasons;

Using the umbrella term market area avoids the confusing and possibly negative implications of the other terms.

A market area can include neighborhoods, cities and counties, and combinations of both.

It is often necessary to go a substantial distance from the subject to obtain current comparable sales. The distance is not as important as how comparable the sales are to the subject. An important question is would the buyer consider the comparable as a substitute for the subject. Does it have a substantial number of the attributes that contribute to value and does it have a similar highest and best use as the subject? Attributes similar/comparable to the subject require less adjustment and result in a better estimate of market value for the subject.

PROPERTY DESCRIPTION

COUNTY: Polk TRACT Madden DATE INSPECTED: 9/20/2024

LOCATION: From intersection of US 59 on north edge of Corrigan proceed east 3.85 miles to 31.008822 and -94.768740. Tract is about 1000 feet south of FM 352 near the midpoint of the tract.

LEGAL DESCRIPTION

Re: 44.06 acres more or less in the A. Mardez Survey A-48 all in Polk Co., Tx.

CONFIGURATION: Elongated, Irregular.

IMPROVEMENTS: None,

TOPOGRAPHY: Rolling uplands with about 60% in bottom subject to flooding.

FLOOD ZONE: 60% UTILITIES: None

SOILS: Mostly sandy loams to fine sandy loam. This tract has a high pine and hardwood site index.

TAXES The appraisal district has this tract on the 2024 tax roll as 40.5 acres for \$324,324 or \$8,008 per acre. This is up 18.5 percent over the 2023 value. It is currently taxed under productivity.

The appraiser has no data to verify the market value rate by the CAD on this landlocked tract with 60% shown in Flood Zone A.

ZONING None

Remarks:

The highest and best use of the as subject as vacant "as is" is timber production, investment and recreation. The highest and best use of the tract as improved is rural residential, timber production, investment and recreation.

This tract is not far from the Corrigan-Camden Mill.

Current Aerial illustration of the subject

This is an aerial view illustrating multiple opportunity routes for access. This view is from above FM 352 about 1000 feet north of the subject.

Below are numerous photographs taken of the subject land.

Note: Small deviations possibly found in the table values are due to rounding in calculations.

Terrain cross section from west to east on the tract.

TIMBER VALUE ANALYSIS

Typically, standing timber contributes additional value to real estate over and above the value of the bare land. The real estate market recognizes this value and attributes it to one or more of three sources:

1. *Merchantable timber value*-the price which wood consuming industries (pulp and paper, lumber, structural panels) will pay for standing timber “on the stump,” a.k.a. “stumpage value,”
2. *Aesthetic value*- the additional value the market assigns to the real estate as a result of having trees add visual appeal to the property,
3. *Damage prevention or resource preservation value*-the additional value the market assigns to real estate resulting from having trees on the property which prevent erosion, provide windbreaks, provide shade for livestock, provide mast for wildlife, and/or provide other natural resource related values.

The contribution of each of the sources of timber value makes a particular parcel of land vary from tract to tract. There is often overlap of two or more of the value sources, depending on the property’s location and the competing properties in the neighborhood. Standing timber may have a certain value if sold and separated from the land, but may not contribute that full timber sale value to the property while it is still attached. This sometimes lesser value that a particular timber stand *contributes* to the value of the whole property is referred to as “contributory value”.

Many market participants (especially timber dealers) in timberland purchases do not normally assign full timber value to their offering price for combined land and timber. When bidding on land and timber combined, they apply a discount to the timber value.

They consider the difference their profit. It is also a way to reduce their risk of loss. The following sources of risk related to timber purchases exist:

1. Delivered timber markets can change quickly, causing prices to fall before the timber can be harvested and delivered to a mill.
2. Timber is measured at mill by weight. Timber is estimated in the forest by volume. Weight to volume conversions vary significantly depending on tree taper, geographic area, topography, and other factors. The timber field estimate can be based on incorrect weight to volume conversions.
3. Local mill wood usage can vary and cause sharp fluctuations in demand and market availability.

The discount, which timber dealers apply to timber in a land and timber transaction, varies with each tract, but can range from none to thirty percent, or more. Any timberland sale where the timber is discounted more than thirty percent should be reviewed before consideration as a “market value sale,” by definition. The seller may not have been well enough informed about timber volumes and values for the sale to qualify.

Hartman Forestry Consultant Services, LLC did a cruise on the 44.06 acres (9-28-2024). This consisted of placing 33 sample points on a random grid across the tract perpendicular to the

creek as to better sample the terrain/stand variation. There were two timber stands on the tract. One was the pine stand on the west part of the tract that extended into the bottom along the tributary feeding McManus Creek to the east of the subject. There is some pine mingled in the bottom with the hardwood stand. The eastern part of the tract has mostly hardwood.

The tract was cruised as one stand and the values are the average across the tract. There are three values calculated for the tract.

Texas A and M Timber Price Trends Trailing Average for 24 Months. Results \$1,214.39/ac

Texas A and M Timber Price Trends Bi-Monthly May/June 2024 (Current) Results \$1,223.98/ac

Current Market -Consultant Data \$875.89/ac

The appraiser has averaged the Texas Timber Price Trends. They represent a broader market period. This is \$1,219.19 per acre. Then the current market value \$875.89 is averaged with this number. This likely illustrates summer prices. The result is a blended average of \$1,047.54. This is the gross timber value per acre used for the contributory value of the timber.

This tract is a little unusual because the tract is still wet in some areas. The tract has a gentle slope and a lot of overstory that hinders drying. Normally, this tract could be logged in August through November. If this tract is logged in wet weather it will result in severe harvesting damage to the bottom. The creek area needs to be protected by a stream management zone. This is suggested by the Texas A& M - Texas Forest Service Best Management Practices. Timing of harvest on this tract is very important as to optimizing the value of the timber and minimizing damage to the bottom and remaining hardwood

Based on the above information and experience of the appraiser the estimated contributory value of the timber is 80% of the total value as calculated. This is:

$$\text{\$1,047.54} \times .8 (80\%) = \text{\$838 per acre (Rounded)}$$

Hartman Forestry Consulting Services, LLC is not responsible for the methodology nor the contributory value of the timber calculated by the appraiser.

.

HIGHEST AND BEST USE DEFINED

A property is an integral part of its neighborhood and cannot be treated as an entity separate and apart from its environment. The value of real property is not intrinsic, but flows into the property from the surrounding vicinity and shares the future with the neighborhood in which it is located.

Real estate is valued in terms of its highest and best use. The highest and best use of a property must be determined before it can be valued. The highest and best use of the site as if vacant may be different from the highest and best use of the improved property. This will be true when the improvement is not an appropriate use and yet makes a contribution to total property value in excess of the value of the land.

Highest and Best Use is defined as that reasonable and probable use that supports the highest present value, as defined, as of the effective dated of the appraisal. Alternatively, that use from among reasonably probable and legally alternative uses, found to be physically possible, appropriately supported, financially feasible, and which results in the highest land value.

HIGHEST AND BEST USE ANALYSIS

After satisfying the four criteria of being physically possible, legally permissible, financially feasible and maximally productive, the remaining use is considered to be the highest and best use of the property.

After analyzing the existing improvements and the data gathered in the site analysis, the following analysis was made which considers the highest and best use as if improved with a residential or recreational improvement. In each analysis, the property will be considered for all uses that are physically possible, legally permissible, financially feasible and maximally productive.

Summary

Neighboring properties are used investment, recreation, timber production, pasture and rural residences. There are some rural residential properties in the vicinity in the neighboring subdivisions. The appraiser has driven a lot of the vicinity. There is land for sale in the area and these are a mixture of tract sizes. The CAD, local brokers and appraisers interviewed told me land sales have been fairly active. The appraiser was able to obtain a number of fairly current sales and some very current.

The highest and best use of the subject property as vacant is rural residential ,recreational, timber and investment. This is rural acreage this is the common use around the subject.

The highest and best use of the subject property as improved is rural residential, recreational, timber production and investment. Neighboring properties have similar uses.

VALUATION ANALYSIS – APPROACHES TO VALUE

In the appraisal of real estate, there are three valuation approaches, or techniques, which are traditionally used: 1) the Cost Approach, 2) Comparison Sales Approach, and 3) the Income Capitalization Approach.

The Cost Approach is based on the simple idea that value is equal to the cost of production. The Cost Approach is based on the premise that the value of a property can be derived by adding the estimated value of the land to the current cost of constructing a reproduction or replacement for the improvements, and then subtracting the amount of depreciation in the structures from all causes. There were no improvements and this approach was not used.

The Comparable Sales Approach is based on the idea that the market value of a property is directly related to the sales prices for which comparable, competitive properties have recently sold. To apply the Direct Sales Comparison, an appraiser gathers data on recent past property sales considered competitive with, and comparable to the subject property. This data (called “comparable sales”) is then analyzed for specific differences with the subject property, adjustments are made to account for the differences with the subject property, and a range of values is indicated for the subject. The appraiser then reconciles the differences into an indication of value for the subject. This approach is basic to the valuation process in that value is equated to the expectations, desires, and motivations of buyers and sellers in the market. Obviously, this approach is most useful when a number of comparable properties have recently been sold. This approach has wide applicability for a variety of appraisal situations. Direct comparison techniques are widely used throughout the other approaches and the appraisal process. When sufficient data is available, it is the most direct and systematic approach to value. It is usually the most appropriate and reliable approach for valuing unimproved vacant timberland, such as the subject.

The Income Capitalization Approach is based on the idea that value is directly related to the benefits that a property is capable of producing. A property’s benefits are its income stream and its resale. The Income Capitalization Approach is therefore typically used to appraise income-producing properties. The Income Capitalization Approach is most appropriate when the potential buyer is using the appraisal analysis to evaluate the property for investment purposes. This is not an income property.

The application and use of the three approaches is dependent upon the appraisal assignment and specific property type. One approach may be more suitable to estimating value than others. Typically, all three approaches are used in estimating value for improved properties, while only the Direct Sales Comparison Approach is used in estimating the value of vacant land.

SUMMARY

The Comparable Sales Approach is considered the most appropriate and applicable approach for the subject tract. Based on the client’s needs this is the most applicable approach. It is the most applicable approach for this size acreage with a similar highest and best use. This is the only approach used.

MARKET VALUE ANALYSIS

There are many factors that contribute to the value of land. These factors include location, market conditions, financing, time of sale, interest owned, zoning, access, size, topography, utilities, scenic views, timber, minerals, and the configuration of the tract. These factors are the most important ones that determine the highest and best use. The appraiser has reviewed the attached comparable sales and several other sales on file. The subject has been carefully reviewed as to how it relates in the above factors to the comparable sales. This relationship is a strong indication of the value of the subject.

Land sales are stable here and the prices appear to be rising and stable. The attached comparable sales are considered relatively current land sales and were obtained from appraisers, principals and brokers in the market area and from the appraiser's own file data. The sales have been adjusted for time if appropriate and market conditions in the analysis.

The tract may be subject to the rollback provisions of the tax law if there is a change in use.

Due to the type of improvements the appraiser did not consider the Americans with Disabilities Act to be a substantial factor in this appraisal. The Endangered Species Act was also considered in the value of the subject acreage. The appraiser did not observe any obvious plants or animals that would involve the Endangered Species Act.

Income Potential of Subject Property

The Outlook for Texas Land Markets research was also reviewed. My research revealed that rental rates are typically between \$7 to \$15 per acre/year for acreage tracts to hunt on in the local market. The rental rate can fluctuate based on several factors including quality of recreation, overall land quality and size. It was also reported that a rental rate above or below the indicated range is not uncommon for extreme outliers.

Considering the size and configuration of the subject it would support about two hunters at \$500 each or \$ 1,000 per year. This is near \$23 per acre and this is not unusual for hunting leases for small acreage tracts. Lessees look at the lease as a unit and where it is located. This rental would cover the note for about one month of the year. This is not an income type property. It is recreational , investment and timber production. This has to assume hunting access.

The application and use of the three approaches is dependent upon the appraisal assignment and specific property type. One approach may be more suitable to estimating value than others. Typically, all three approaches are used in estimating value for improved properties, while only the Comparison Sales Approach is used in estimating the value of vacant land. Only the comparable sale approach is used in this appraisal. The contributory value of the timber is discussed elsewhere in the report. The appraiser has analyzed the value of the subject property using the Adjusted Comparable Sales Grid that follows for the land:

COMPARABLE SALES GRIDALL - ADJUSTED TO BARE LAND VALUE

COMMENTS ON ADJUSTMENTS

Sale 1 was 32 acres that sold for a reported \$3,500 per acre. The buyer told the appraiser the tract had about 3.5 loads per acre of timber on it. The timber is cut but the aerial photograph and aging indicate the tract was well stocked with some good timber. This indicated the timber value was about \$2,000 per acre as it contributed to the sale. This leaves \$1,500 per acre in the land and that is well below market. This is supported by nearby comparable sales. The seller is likely related, a friend or uninformed on the market.

This tract has better location, frontage, elec, and water. Superior to the subject.

Sales 1,3, and 8 indicated the actual market value of this sale to be estimated at \$7,250 per acre. The indicated value of the subject would be \$3,600 per acre.

Sale 2 is a large tract with low timber volume and easement by access. It is about comparable to the subject except the location is a little inferior to the subject.

Sale 3 is a good tract with Hwy frontage and some timber. It has a pond. There is electricity and water. Superior to the subject in terrain and access.

Sale 4 This sale front FM 352 and is across from Sale 2 on the highway.

Sale 5 sets in Hwy 352 west of Sale 1. This tract is a little larger than the subject and has better access and terrain.

Sale 6 is northeast of Corrigan on an easement off FM 1987. It is similar to the subject but has electricity and water.

The sales ranged from \$3,354 per acre to \$4,800 per acre as adjusted. The average value of the comparable sales as adjusted is \$4,047 per acre. With Sale 1 corrected for estimated market value the average is \$3,973 per acre. This is for the hypothetical assumption the tract has access, without water and electricity. This is land value only.

The land value is estimated to be \$4,000 per acre. This is with an assume easement in place from FM 352 north of the subject. It does not include electricity and water (well) .

MARKET VALUE ANALYSIS SUMMARY

The value range of the adjusted comparable sales is shown on the Comparable Sales Grid. All of the tracts would be considered competitive and located in Polk County. The subject is a typical acreage tract with a good location in Polk County.

This tract is within easy driving distance to Houston, Lufkin and Livingston. There are nearby lakes for recreation. The tract has good proximity to shopping and medical care.

It has all of the attributes of a rural residential, recreational, timber growing and investment tract. The configuration is adequate and it has privacy , places to build a residence or camp.

The appraiser has noted a modest improvement in the land activity. It appears buyers are not expecting land prices to go down. They are getting more acclimated to higher interest rates. The Federal Reserve has indicated they are likely to start lowering interest rates to keep the economy flowing in 2024. They buyers realize they can refinance.

Indicated value is based on the analyses and conclusions within the report, subject to definitions, and assumptions and limiting conditions stated in the report, it is the appraiser's opinion and conclusion the market value of the subject property as of 9/20/2024 is indicated to be:

WITH HYPOTHETICAL ASSUMPTION THE TRACT HAS LEGAL ACCESS:

Land value of 44.06 acres at \$4,000 per acre	= \$176,240
Contributory value of 44.06 acres timber at \$838 per acre	= \$36,922
Total tract value	= \$213,162 or \$4,838/ac

TWO HUNDRED THIRTEEN THOUSAND ONE HUNDRED SIXTY-TWO DOLLARS

THE VALUE OF THE TRACT AS LAND LOCKED WITH THE ASSUMPTION THE TIMBER COULD BE HARVESTED IS ESTIMATED TO BE AS OF 9/20/2024:

Land value of 44.06 acres at \$4,000 less 40% discount per acre	= \$105,744
Contributory value of 44.06 acres timber at \$838 per acre less 40% discount per ac	= \$ 22,153
Total tract value	= \$127,897
	Per acre discounted \$2,903

ONE HUNDRED TWENTY SEVEN THOUSAND EIGHT HUNDRED NINETY-SEVEN DOLLARS

The appraiser has substantial data regarding the discount from landlocked tracts. Typically there is a 35-45% discount for a landlocked tract. There is a document in the addenda that give support as to why tracts are discounted for access.

Often the adjoining landowner will give more for the tract than other buyers. This is a result of them wanting to add to their property for various reasons. Or it may be they have access to the landlocked tract and can avoid paying full market price for other acreage down the road.

Texas Forestry Association –Accredited Forester No. 48 12/31/ 2025

ADDENDA

SUBJECT AND COMPARABLE SALES FOR MADDEN 44.06 ACRES POLK CO., TEXAS

COMMENTS ON ACCESS AND DISCOUNTS (LAND LOCKED PARCELS)

The appraiser does contract work buying access and often the adjoining owners use the access as leverage to try and buy the tract cheaper. Often the adjoining owner will not grant an access easement across their land if they want to buy a tract or they do not want to put up with hunters crossing their property for access or harvesting that results in road damage. The appraiser has found on several tracts acquired the cost is seldom less than \$3.00 to \$4.00 per lineal foot. This figure was obtained from professionals familiar with process. Often the owner granting an easement realizes they have enhanced your property and want part of the new value. This will increase easement cost. This (\$10,000 - \$20,000) just appears to be the least amount that will motivate a grantor to sell an easement. It is seldom they will grant an easement just because the owner or proposed buyer needs it. It takes time to work easements out and the surveying cost can be in the thousands of dollars and the acquisition work is usually in the \$3,000 to \$10,000 range. In addition, there is legal, survey and title policy cost. This does not include the cost of road building or obtaining electricity in needed.

One of the ways to establish the discount on a landlocked tract is the cost to cure. If an easement were possible the cost estimate would be similar to the following:

Field work and identifying a proposed route and easement grantor	\$2,000
Roadwork estimate	\$2,000
Purchase easement (large variation possible) \$3.50 -\$4.00 / Lineal ft.	\$10,000
<u>Surveying and legal (large variation possible)</u>	<u>\$5,000</u>
Total (This varies with each situation, but illustrative)	\$19,000

Unfortunately, easement cost does not typically vary with tract size. It may be same cost to get to 18 acres as a 50 acre tract. The easement cost will often be what the owner thinks granting an easement is worth to the buyer of the easement. access on a small acreage tract. On the illustration above the cost on the 18 acres would be approximately \$1,055 per acre and on the 50 acres it would be \$380 per acre.

On a tract that has good potential for an easement and a change for the better on highest and best use the property owner and the potential grantor of an easement both smell money and the potential for profit and the corresponding cost go up.

Sale to an adjoining owner usually results in the best price. They have the access available. If another buyer without access has to acquire access the price will be discounted significantly to solve the access. The typical discount and sale information the appraiser has on file indicate a 40%-50% discount is typical.

The appraiser has visited with several real estate people, appraisers, land buyers , and the appraiser's own experience. Some of these people were reluctant to disclose any specific sale data as they are considered trade secrets. When posed the question what do you think a reasonable discount is for a landlocked tract ? The answer was 40%-50%.

In regard to assemblage of a small landlocked tract into large acreages. The discussion with REIT's and TIMO personnel they told the appraiser they were not inclined to buy small parcels because of the cost to acquire as a result of paperwork, time involved by personnel, legal expense and the process of acquiring by these. In regard to a specific tract, if the surrounding owner or owners have no interest in buying the tract and other outside parties have no interest in acquiring the tract it has minimal value to no value.

The steep discount on undivided interest and landlocking is also a result of the lack of financing for this type property. Lenders will not typically loan on tracts without access or undivided interest. Cash buyer always look for a good deal and want a good return for their risk.

Estate tax appraisals and partitioning of properties. The appraiser has over forty years experience as a fee appraiser. The appraiser has made over 2,500 appraisals during this time period. Most of the appraisals have been rural land, single family residential, and land with development potential.

Expert witness testimony has been made by the appraiser in Nacogdoches, Jasper, and Newton, Hardin, San Jacinto and Tyler counties. The appraiser has worked for most of the major financial institutions around Lufkin, Nacogdoches, Diboll, Huntington, Jasper, Newton, Woodville and Kirbyville. The appraiser has also worked for relocation companies, attorneys, counties, cities and Texas Department of Transportation for ROW acquisition. The appraiser has worked for a consulting firm doing studies on ranches for the I-69 Corridor planning.

Some of the major projects completed by the appraiser are a large number of tracts for International Paper Realty, Blue Sky Timber Properties, Campbell Timberlands, LLC, Temple-Inland and the Trout Creek Drainage Control Project for the City of Kirbyville and the Corp of Engineers and condemnation work on the improvement of Highway 96 south of Jasper for TxDOT. The appraiser has appraised numerous acreage tracts scattered over several counties and has been involved in the appraisal and acquisition of major company land purchases. The appraiser has substantial experience working with and appraising large acreage holdings. The appraiser has worked with most of the major timberland owners and timber companies in Angelina County and the East Texas Area. The appraiser is a professional forester and has ten years' experience working for International Paper Company in various capacities and two years as forest economist and tax analyst. The appraiser/

forester worked for Kirby Forest Industries as timber procurement supervisor. Major areas of expertise include forest management, forest economics, timber procurement, land development and real estate appraisal work. The appraiser has operated a fee appraisal business for over thirty-five years.
